## Gravity loads

- **Non-structural permanent loads:**

**Soundproof insulation** - The acoustic insulation of  $t = 10$  mm and with a weight per unit volume of  $\gamma = 0.30$  kN/m<sup>3</sup>

**Floor screed** The floor screed is made by lightweight aggregates with  $t = 50$  mm and  $\gamma = 7.2$  kN/m<sup>3</sup>.

**Floor** of ceramic tiles with a  $\gamma = 10$  kN/m<sup>3</sup> and  $t = 20$  mm.

**Thermal insulation** made of fiberglass of  $t = 100$  mm and  $\gamma = 0.10$  kN/m<sup>3</sup>

**Ceiling** made of plasterboards  $t = 20$  mm with  $\gamma = 0.177$  kN/m<sup>2</sup>.

**Internal partition walls** have a unit weight less than 1 kN/m, hence, according to EC1, it is possible to model their weight as a uniform load equal to 0.50 kN/m<sup>2</sup>.

	Weight per unit volume (kN/m <sup>3</sup> )	Thickness (m)	Loads (kN/m <sup>2</sup> )
Soundproof insulation	0.30	0.010	0.003
Floor screed	7.20	0.050	0.360
Floor	10.00	0.020	0.200
Thermal insulation	0.10	0.100	0.010
Ceiling			0.177
Internal partition walls			0.5
Total value of non-structural permanent loads		$g_{k2} =$	<b>1.25 kN/m<sup>2</sup></b>

ASSUMPTIONS

STRUCTURAL  
ANALYSIS

COMPARATIVE  
ASSESSMENTS

- Structural permanent loads:  $g_{k1} = 1.75 \text{ kN/m}^2$
- Non-structural permanent loads:  $g_{k2} = 1.25 \text{ kN/m}^2$
- Live loads:  $q_k = 3.00 \text{ kN/m}^2$

## Ultimate limit state combination for gravity loads:

$$\begin{aligned}
 q_d &= \gamma_g (g_{k1} + g_{k2}) + \gamma_q q_k \\
 &= 1.35(1.75 + 1.25) + 1.5 \times 3.0 = 8.55 \text{ kN/m}^2
 \end{aligned}$$

*Eq (6.10), Table A1.1 and A1.2 – EN 1990:2004*

## Design of beams of gravity load resisting system

- The beams are designed to withstand a load combination of  $q_d = 8.55 \text{ kN/m}^2$ .
- The reactions corresponding to the supports is:

$$R_i = 1.10 q_d l = 1.10 \times 8.55 \times 2 = 18.81 \text{ kN/m}$$

$$R_e = 0.40 q_d l = 0.40 \times 8.55 \times 2 = 6.84 \text{ kN/m}$$

- The maximum moment in the midspan of secondary beams is:

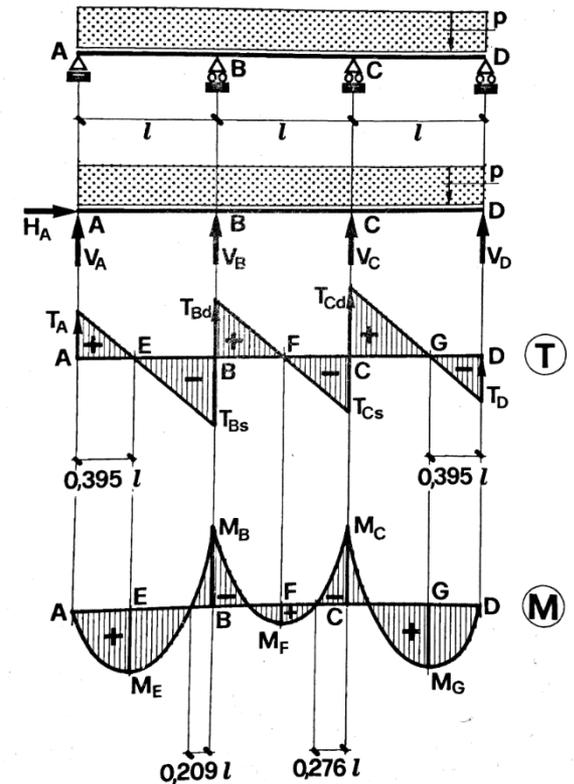

$$M_{max} = R_i \frac{L^2}{8} = 18.48 \times \frac{6^2}{8} = 84.6 \text{ kNm}$$

$$\rightarrow W_{pl} = \frac{M_{max}}{f_y} = \frac{84.6 \times 1000}{355} = 238.3 \text{ cm}^3$$

-> IPE220

$$M_{Rd} = \frac{285.4 \times 10^3 \times 355}{1.00} \cong 101.32 \text{ kNm}$$

- The secondary beams have been also checked against serviceability requirements.

ASSESSMENTS

## Design of beams of gravity load resisting system

- The concentrated load due to the adjacent secondary beams is:

$$P = (2 \times 18.86 \times 6) / 2 = 112.86 \text{ kN}$$

- The maximum moment acting on these beams is equal to:

$$M_{max} = Pa = 112.86 \times 2 = 225.72 \text{ kNm}$$

$$\rightarrow W_{pl} = \frac{M_{max}}{f_y} = \frac{225.72 \times 1000}{355}$$

$$= 635.8 \text{ cm}^3 \rightarrow \text{IPE330}$$

$$M_{Rd} = \frac{804.3 \times 10^3 \times 355}{1.00} \cong 285.526 \text{ kNm}$$

<b>SEISMIC DESIGN</b>
MODELLING ASSUMPTIONS
STRUCTURAL ANALYSIS
COMPARATIVE ASSESSMENTS

## Additional permanent loads

- $44 \times \text{IPE220}$  per floor = 67.85 kN
- $12 \times \text{IPE 330}$  per floor = 34.68 kN
- $16 \times \text{IPE 300}$  per floor = 40.48 kN.

○ The total weight of beams is equal to:

$$g_{bk} = 67.85 + 34.68 + 40.48 = 143.00 \text{ kN}/(24\text{m} \times 24\text{m}) = g_{bk} = 0.245 \text{ kN}/\text{m}^2$$

- The total permanent loads:  $\rightarrow g_{k1} + g_{k2} + g_{bk} = 3.245 \text{ kN}/\text{m}^2$
- The weight of external walls of 3.5 m height is  $0.16 \text{ kN}/\text{m}^2 \rightarrow 53.76 \text{ kN}/\text{floor}$

## Total permanent masses for the evaluation of the seismic loads:

- Intermediate storey:
 
$$3.245 \times (24 \times 24) + 53.76 = 1922.88 \text{ kN} = \mathbf{192.3 \text{ tons}}$$
- Roof:
 
$$3.245 \times (24 \times 24) + 53.76/2 = 1896.00 \text{ kN} = \mathbf{189.6 \text{ tons}}$$

## Floor mass

## Seismic forces

- $a_g = 0.35g$ ;
- Soil Type "B";
- Damping = 5%;
- Type 1 spectrum
- The torsional effects are neglected;
- $q = 6$  (for **MRF**)
- $T_1 = C_t H^{3/4} = 0.83 \text{sec}$

$a_g$  is design ground acceleration

$q$  is behaviour factor

$T_1$  is fundamental period

$C_t$  for moment resistant space steel frames is 0,085 .

$H$  is a height of the building, in m, from the foundation or top of a rigid basement

# Seismic design combination

○ **Lateral load resisting frame parallel to the secondary beams**

- Vertical loads:

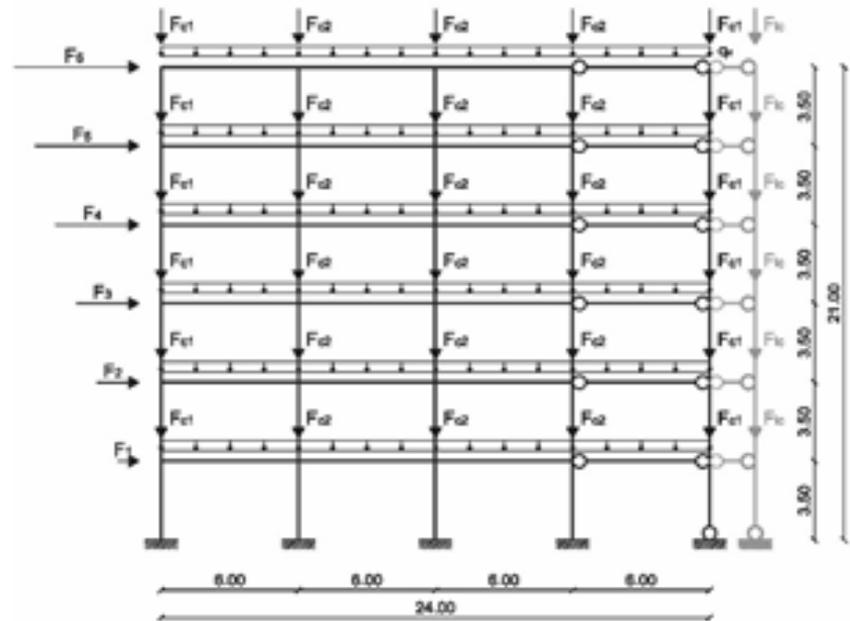

$$\Sigma G_{k,i} + \Sigma \psi_2 Q_{k,i} = 3.245 + 0.3 \times 3 = 4.145 \text{ kN/m}^2$$

→ distributed loads acting on beams of seismic resistant schemes

$$q_d = 0.40 \times 4.145 \times 2 = 3.316 \text{ kN/m}^2$$

- Concentrated loads on columns based on the seismic load

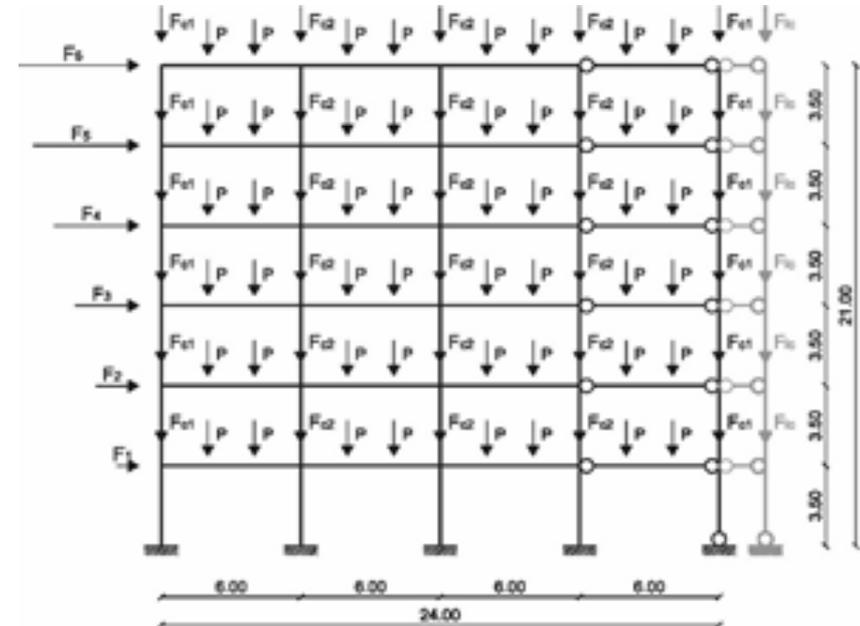

Storey	$F_{c1}$ (kN)	$F_{c2}$ (kN)	$F_{lc}$ (kN)
1	30.72	58.10	905.40
2	30.72	58.10	905.40
3	30.72	58.10	905.40
4	30.72	58.10	905.40
5	30.72	58.10	905.40
6	29.04	56.40	900.36

## Seismic design combination

- Lateral load resisting frame orthogonal to the secondary beams
  - Concentrated loads on columns based on the seismic load

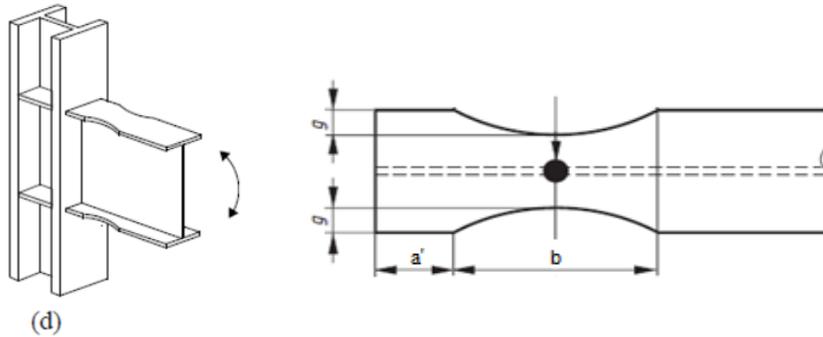

Storey	P (kN)	$F_{c1}$ (kN)	$F_{c2}$ (kN)
1	27.36	13.31	23.26
2	27.36	13.31	23.26
3	27.36	13.31	23.26
4	27.36	13.31	23.26
5	27.36	13.31	23.26
6	27.36	11.63	21.58

- Lateral load resisting frames arranged orthogonal to secondary beams do not have distributed loads but concentrated loads with a span of 2 m (P).

## Modelling assumptions of MRFs

- Reduced beam sections (RBS / Dog-bones)

Joint Type	Geometry
DB-S: Full-strength with strong panel zone (Type "d")	$a = 0.6b_f$ $b = 0.75d_b$ $s = a + \frac{b}{2}$ $g = 0.2b_f$

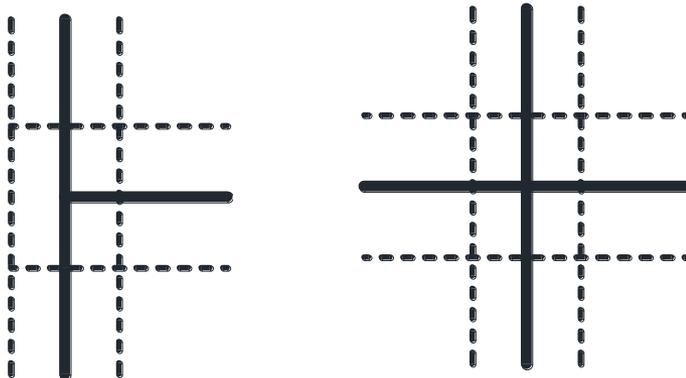

Equaljoints design manual

- S355 steel ( $\gamma_{ov}=1.25$ )
- Rigid constraints - at each floor
- "P-Δ column" (leaning column) - modelling second-order effects from "gravity" frames
- Seismic mass - assigned to nodes of lateral load resisting frame

# Modelling assumptions

## Simplified approach

- Eurocode-based design and preliminary assessment of seismic performance of frames;
- Beams intersect columns in nodes
- Elastic beam elements only

- STRUCTURAL CONFIGURATION
- ACTIONS
- DESIGN FOR GRAVITY LOADING
- SEISMIC DESIGN
- MODELLING ASSUMPTIONS**
- STRUCTURAL ANALYSIS
- COMPARATIVE ASSESSMENTS

## Structural analysis

- **Seismic load combinations:**

- Ultimate Limit State (ULS):**

- for dissipative elements:  $\sum G_{k,j} + \sum \psi_{2,i} Q_{k,i} + \alpha(A_{Ed} + I)$
    - for non-dissipative elements:  $\sum G_{k,j} + \sum \psi_{2,i} Q_{k,i} + \alpha(\Omega_T A_{Ed} + I)$

- **Second order effects** should be accounted for, by multiplying the seismic action by  $\alpha$  if  $\theta > 0.1$

where

$$\alpha = 1/(1 - \theta)$$

$P_{tot}$  is the total gravity load at and above the storey considered in the seismic design situation

$$\theta = \frac{P_{tot} d_r}{V_{tot} h} \leq 0.1$$

$d_r$  is the design interstorey drift, evaluated as the difference of the average lateral displacements  $d_s$  at the top and bottom of the storey under consideration and calculated;

*Eq. (4.28) – EN1998-1*

$V_{tot}$  is the total seismic storey shear;

$h$  is the interstorey height;

$\Omega_T$  is multiplicative factor on design seismic action, for the design of the non-dissipative members (or structural system overstrength) (6.6.3 and 6.8.3 – EN1998-1)

## Structural analysis

- **Seismic load combinations:**

- **Serviciability Limit State (SLS):**

- $\sum G_{k,j} + \sum \psi_{2,i} Q_{k,i} + vqA_{Ed} + I$  (4.3.4 and 4.4.3.2 - EN 1998-1)

- q is behaviour factor considered for assessment of displacements induced by the design seismic action resulted from a linear elastic analysis (4.3.4 – EN1998-1)

- v is the reduction factor which takes into account the lower return period of the seismic action associated with the damage limitation requirement and is considered 0.5.

- **Limitation of interstorey drift**  $d_r v = 0.010 h$  (4.4.3.2c) - EN 1998-1)

- $d_r$  is the design interstorey drift as defined in 4.4.2.2(2) – EN1998-1

- h is the storey height;

- **Modal response** spectrum elastic analysis (4.3.3.3 – EN 1998-1) – RSA2016

- **Global imperfections** considered by applying Equivalent Horizontal Force (EHF) at each story.

## Structural analysis

### ○ ULS

- Dissipative elements and structural over-strength:
  - Beams
  - Global structural dissipative behaviour - individual values of ratios  $\Omega_i$  do not exceed the minimum value by more than 25%

### • Non-dissipative elements:

- Columns

- Second order effects was not accounted as  $\theta = 0.1$

### ○ SLS

Limitation of interstorey drifts:  
limit of 0.01h => increase sections

- $T_1=0.85\text{sec}$
